# WATER-LEVEL DATA FROM OBSERVATION WELLS IN THE NORTHERN PANHANDLE OF TEXAS

## INTRODUCTION

The complete historical water-level records for approximately 825 wells, which are located in 10 counties in the northern Panhandle of Texas, are presented in this report. The water-level measurements are mainly from wells located in areas of large withdrawals of ground water for irrigation, industrial, and municipal use.

The principal aquifer in the area is the Ogallala Formation of Tertiary age. This formation varies in total thickness from a few feet to more than 900 feet in the approximately 10,000 square miles covered by this report. Most of the wells in this report produce only from the Ogallala Formation.

Overlying the Ogallala is a variable thickness of Pleistocene deposits, usually less than 50 feet thick. The Pleistocene consists primarily of sand with lenses of caliche. A layer of indurated caliche or caprock usually is present near the top of the Ogallala. The water table is usually considerably below the caprock material and the Pleistocene deposits.

In local areas of the northern Panhandle, primarily in Dallam County, rocks of Cretaceous and Jurassic age beneath the Ogallala are water-bearing. However, these older water-bearing rocks are, in most places, in contact with the Ogallala and therefore are hydrologically connected to the Ogallala. The water-level records for the few dual-completed wells, as a general rule, reflect the water level in the Ogallala Formation.

The Ogallala is a stream-deposited formation, composed generally of light-colored sand, silt, clay, and gravel, which forms a large unconfined ground-water reservoir. Water is stored in the void spaces between the grains of material which make up this formation. The specific yield of the Ogallala for the area covered by this report has not been precisely determined. However, 15 percent has been used by most investigators when making estimates of the volume of water in storage.

Water is pumped from the Ogallala aquifer in the northern Panhandle for irrigation, industry, municipalities, and for domestic and livestock purposes. However, the major use of water in the area is irrigation.

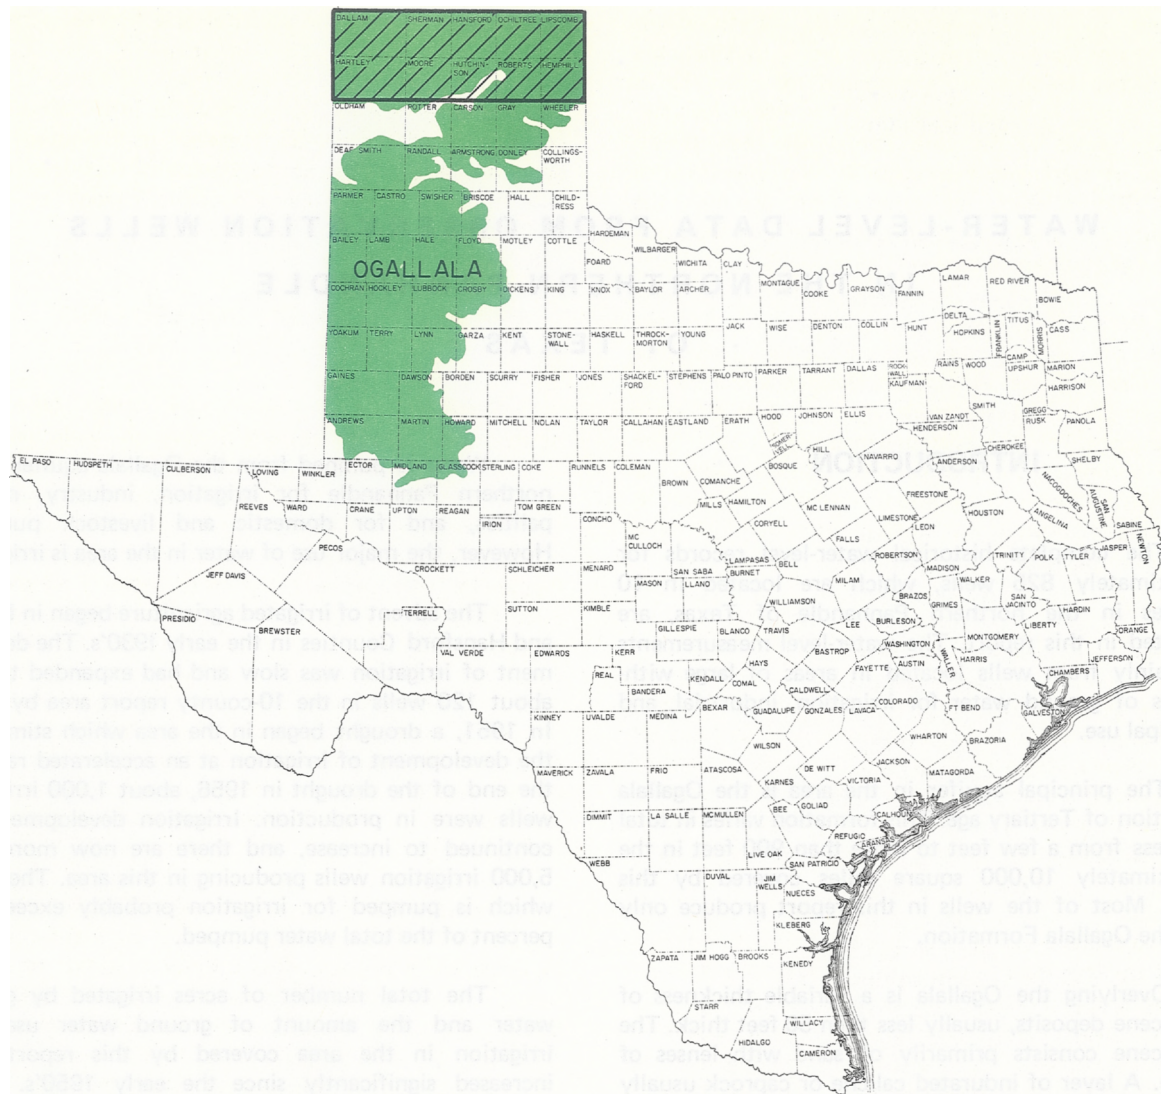

The advent of irrigated agriculture began in Dallam and Hansford Counties in the early 1930's. The development of irrigation was slow and had expanded to only about 120 wells in the 10-county report area by 1950. In 1951, a drought began in the area which stimulated the development of irrigation at an accelerated rate. By the end of the drought in 1956, about 1,000 irrigation wells were in production. Irrigation development has continued to increase, and there are now more than 5,000 irrigation wells producing in this area. The water which is pumped for irrigation probably exceeds 90 percent of the total water pumped.

The total number of acres irrigated by ground water and the amount of ground water used for irrigation in the area covered by this report have increased significantly since the early 1950's. Texas Water Development Board Report 127, *Inventories of Irrigation in Texas, 1958, 1964, and 1969*, enumerates these increases as follows:

YEAR	ACRES IRRIGATED	ACRE-FEET USED
1958	317,980	363,287
1964	630,059	848,171
1969	1,143,485	1,378,400

Additional information on irrigation, including surface-water usage and type of crops, may also be found in that report.

The changes in ground-water conditions in the Panhandle of Texas are of major concern to the ground-water users and to all others who are directly or indirectly affected by the agricultural economy generated by the irrigation pumpage. The Texas Water Development Board receives numerous requests annually

**Extent of the Ogallala Aquifer in Texas and Area Covered by This Report**

for water-level data in the area from individuals, municipal governments, industries, and small businesses.

## **WATER LEVEL OBSERVATION PROGRAM**

Observation wells are measured by the Texas Water Development Board in various areas of the State to observe changes in water levels in the principal aquifers. The Board's Water Level Observation Program is directed toward the accomplishment of several objectives. These objectives are: (1) the selection, in every major aquifer, of a network of wells that are spaced to afford adequate data for preparation of piezometric maps or water-table contour maps referenced to sea-level datum; (2) annual or periodic measurement of water levels in each well in this network made at the time of year when water levels have recovered from the effects of pumping during the season of peak water demand;

(3) the operation of continuous water-stage recorders in representative wells where a continuous record of water-level changes is needed; (4) preparation of maps and graphs that show the fluctuation of water levels as revealed by water-level measurement; and (5) publication of water-level information and evaluation of the data.

In the northern Panhandle, the Board has engaged in a cooperative water level observation program with the North Plains Ground Water Conservation District No. 2, officed in Dumas, Texas. The District was created by the Fifty-First Legislature in 1954, and serves all or parts of Hansford, Hutchinson, Ochiltree, Sherman, Moore, and Hartley Counties. The District is staffed by J. W. Buchanan, manager; Bert. E. Smith, secretary-bookkeeper; and Orval E. Allen and Don Piatt, field representatives.

Prior to the origination of the North Plains Ground Water Conservation District No. 2 in 1954, the United States Geological Survey and the then Texas Board of Water Engineers measured the water levels in observation wells in the area. During the next several years, the measurement responsibility was shared by all agencies. Since 1966, the District has assumed the responsibility of making the annual water-level measurements in the area served by the District.

In the present cooperative agreement, the District measures the water levels in the observation wells located within the bounds of the District and furnishes the Texas Water Development Board copies of these measurements. The Board in turn maintains a water-level recorder program in the District and provides the District with other services. Board personnel measure the water levels in observation wells outside the District in the northern Panhandle.

## FLUCTUATIONS OF WATER LEVELS

The principal long-term changes in water levels in the northern Panhandle have reflected decreases in the overall volume of water stored in the Ogallala aquifer. When pumpage exceeds recharge (which is quite small in this region), most of the water discharged from the aquifer is withdrawn from storage, and water levels decline.

The average decline of the water table for the area covered by this report has been a little over 2 feet per year during the past 10 years. However, the decline of the water table has not been uniform throughout the report area. In some areas of sparse water-well development, the decline has been less than 1 foot per year. In areas of intensive development, the water table has declined an average of more than 5 feet per year. The declines have been influenced primarily by the intensity of well development and seasonal pumpage.

When a water well is pumped, the water table in the vicinity of the well is drawn down in the shape of an inverted cone with its apex at the pumped well. This cone is commonly referred to as the cone of depression. The development or growth of this cone depends on the physical and hydraulic characteristics of the aquifer, and on the rate of pumping.

Where extensive development takes place in an aquifer, each well superimposes its individual cone of depression on the cones of neighboring wells. This results in the development of a regional cone of depression. When the cone of one well overlaps the cone of another, interference occurs and an additional lowering of water levels takes place as the wells compete for water. The amount or extent of interference between these cones of depression depends on the rate and duration of pumping from each well, the spacing

between wells, and the physical and hydraulic characteristics of the aquifer.

If an excessive decline of water levels occurs, the producer can expect an increase in pumping cost, decreased well yields, abandonment of shallower wells, and in some areas, an undesirable change in water quality due to salt-water encroachment.

## METHODS OF COLLECTING WATER-LEVEL DATA

Water levels in most observation wells are measured on an annual basis. If possible, wells selected for annual observation purposes should not be equipped with a pump and should be located a reasonable distance from heavily pumped wells. However, in areas of intense ground-water development, such as in most of the Panhandle area, usually the only wells available for measurements are those equipped with large-capacity turbine pumps. It is then necessary to measure the water levels in those wells after allowing sufficient time following cessation of pumping for water levels to recover to a static or near static level. In irrigated areas, it is most desirable to measure water levels during the winter months when pumping is at a minimum or nonexistent and water levels have recovered to their highest level.

Water levels are reported as depth to water below land surface. This depth is obtained by measuring the distance from a permanent measuring point near the land surface to the water level in the well, and then subtracting the vertical distance between the measuring point and the land surface. Water-level measurements in the northern Panhandle are obtained by one of the following methods:

### (1) Wetted Steel Tape Method

A calibrated steel tape is lowered into the well until a portion of the lower end of the tape is submerged in the water. The depth to water below the well's measuring point is obtained by subtracting the wetted portion of the lower end from the footmark held at the well's measuring point.

Water levels measured with a steel tape are recorded in the Texas Water Development Board's records to the nearest hundredth of a foot. The wetted steel tape method for obtaining water-level measurements is considered the most accurate, and is the method commonly used by Board personnel and by personnel of the North Plains Ground Water Conservation District No. 2.

### (2) Electric-Line Method

The electric line measuring device consists of a hand-operated reel, a current meter, a dry-cell battery

for power, and a length of double conductor insulated wire with electrodes at the lower end. The electric line operates on the principle of a completed electric circuit; when the electrodes on the end of the electric line contact the water surface in the well, the electric circuit is completed and is indicated on the current meter at land surface. Calibrated markings on the electric line provide a means for direct reading of the water level. The electric-line method is used where water-level measurements are unobtainable with a steel tape, such as in wells having leaky casings. Water-level measurements obtained by this method are recorded to the nearest tenth of a foot.

### (3) Automatic Recorder Method

An automatic water-level recorder consists of a float suspended by a metal tape or cable from a recording instrument installed over the well. As the float rises and falls with the water surface in the well, the motion is transferred to a pen which graphs the fluctuation on a clock-driven chart. The continuous recording of water levels in a well affords the best means for observing rapid and irregular water-level fluctuations in areas of large ground-water development.

Recorders are visited at frequent intervals for maintenance, accuracy checks, and collection of the water-level charts. Water-level readings taken from the charts are tabulated to the nearest hundredth of a foot.

## PRESENTATION OF DATA

For each observation well in the Board's Water Level Observation Program, the water-level measurement, date of measurement, pertinent remarks, and initials of the person taking the measurement are recorded in the field on standard forms. The field data are later transferred to punch cards which enable the water-level measurements to be statistically analyzed and the results printed in a concise tabular form by computers and other data processing machines.

The North Plains Ground Water Conservation District No. 2 uses a similar procedure in recording the measurements in the field. The District furnishes the Board with a typed copy of water-level measurements which are then entered on standard forms used by the Board. These measurements are later transferred to punch cards for processing by computers.

Tabulated in this report are the complete records of the water levels from observation wells for 10 counties in the northern Panhandle of Texas. These tables provide the following information: well number, depth of well, elevation of land surface in feet above mean sea level, dates of measurement, measurements of water level in feet below land surface, and changes (decline or rise) in water level from the previous measurement.

Preceding the table for each county is a well-location map. A well symbol and the last three digits of the well number appear on the map at the location of each well listed in the county tabulation.

Hydrographs, showing changes in water level, are presented for selected representative wells following the respective county tabulations. Precipitation data are also shown for stations in or near each county in the report area.

Water-level measurements are presented in this report for many wells which have been lost to the program. Most of these wells have been abandoned and destroyed, some have had equipment changes which make it impossible to enter the well with a measuring device, and others have been lost to the program for various other reasons.

## WELL-NUMBERING SYSTEM

To facilitate the location of wells and to avoid duplication of well numbers in present and future studies, the Texas Water Development Board has adopted a statewide well-numbering system. This system is based on division of the State into a grid of 1-degree quadrangles formed by degrees of latitude and longitude, and the repeated division of these quadrangles into smaller ones as shown in the following diagram.

Each 1-degree quadrangle is divided into sixty-four  $7\frac{1}{2}$ -minute quadrangles, each of which is further divided into nine  $2\frac{1}{2}$ -minute quadrangles. Each 1-degree quadrangle in the State has been assigned an identification number. The  $7\frac{1}{2}$ -minute quadrangles are numbered consecutively from left to right, beginning in the upper left-hand corner of the 1-degree quadrangle, and the  $2\frac{1}{2}$ -minute quadrangles within each  $7\frac{1}{2}$ -minute quadrangle are similarly numbered. The first 2 digits of a well number identify the 1-degree quadrangle; the third and fourth digits, the  $7\frac{1}{2}$ -minute quadrangle; the fifth digit identifies the  $2\frac{1}{2}$ -minute quadrangle; and the last 2 digits identify the well within the  $2\frac{1}{2}$ -minute quadrangle.

On the well-location maps in this report, the 1-degree grid lines are identified with large open-block numerals, and the  $7\frac{1}{2}$ -minute quadrangles are numbered in their northwest corners. The 3-digit number shown with the well symbol contains the number of the  $2\frac{1}{2}$ -minute quadrangle in which the well is located and the number of the well within that quadrangle.

The North Plains Ground Water Conservation District No. 2 uses a numbering system of its own which was developed prior to the adoption of the State well-numbering system. The District assigns well numbers sequentially within each county. When a landowner requests a permit to drill a well, the well number is then permanently assigned for this prospective well and all records thereafter concerning the well are

Location of Well 06-15-701

06 1 - degree quadrangle

15 7 1/2 - minute quadrangle

7 2 1/2 - minute quadrangle

01 Well number within 2 1/2 - minute quadrangle

## Well Numbering System

assigned this number. The District well numbers are listed in this report along with the State well numbers.

## **PERSONNEL**

The Water Level Observation Program of the Texas Water Development Board is conducted by personnel of the Ground Water Division, a Board technical service division, under the general direction of C. R. Baskin, Chief Engineer, and Richard Peckham, Director of the Ground Water Division. This report was prepared under the supervision of Robert Bluntzer, Chief of the Water Availability Branch, and A. Wayne Wyatt, Water Levels Section Chief. The tabulations of water-level data were prepared by the Board's Electronic Data Processing Division under the direction of Mike Parker, Director; David L. Ferguson, Systems Analyst; Bill Treacy,

Commercial Systems Branch Chief; and James Grissett, Programmer.

Members of the Water Levels Section who assisted in compiling this report are Charles Cornelis, David Cunningham, Hershel Davidson, Charles Ferguson, Steve Moore, and Herbert Spradlin.

## **ACKNOWLEDGEMENTS**

Special appreciation is expressed to the many landowners in the area covered by this report for their interest and cooperation in allowing their wells to be measured. The cooperation and assistance of the North Plains Ground Water Conservation District No. 2 and its Board of Directors and staff members are also gratefully acknowledged.
